## Tree Of Life Foundation — Website (Part 2)

### Overview

This repository contains the Tree Of Life Foundation website. Part 2 updates the site after the Part 1 feedback and implements a desktop CSS stylesheet, responsive layout, and README changelog entries.

### What I changed (summary)

- Moved all presentational CSS into an external stylesheet: ``css/style.css``.
- Added a small CSS reset and base typography variables for consistent rendering.
- Implemented a desktop-first layout using CSS Grid and Flexbox, with responsive breakpoints at 1000px and 700px.
- Added responsive images (``picture`` + ``srcset``) for hero imagery.
- Improved accessibility (focus states, semantic elements, ARIA attributes on nav toggle).
- Added a minimal JS toggle for the mobile nav.
- Added instructions for screenshots and evidence to include in README.

Changelog (entries related to Part 1 feedback)

2025-09-22 — Part 2 initial edits (after Part 1 feedback)

**Files changed:** ``index.html``, ``javascript``, ``README.md``, ``images/``

**Why:** Implement feedback received after Part 1 submission and improve styling/responsiveness.

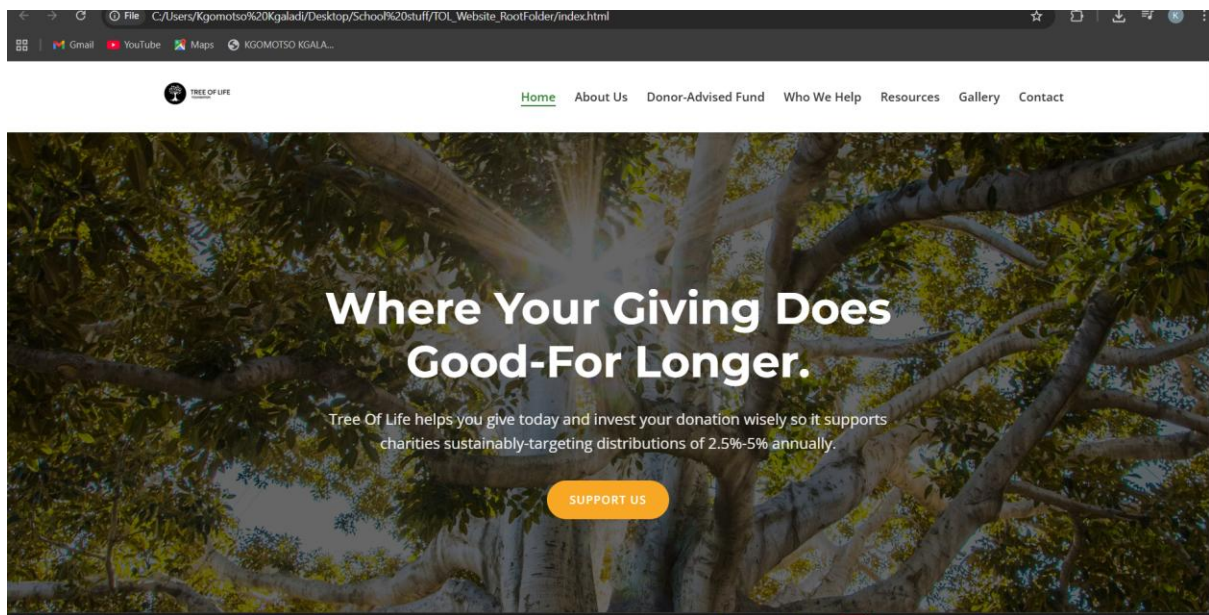

#### Details:

- Externalised inline styles into ``css/style.css`` to satisfy the requirement for an external stylesheet.
- Added a CSS reset and base variables for consistent cross-browser rendering.
- Implemented typography scale and improved ``line-height`` and ``letter-spacing`` for readability across devices.
- Converted key layout areas (hero, main grid) to use CSS Grid and Flexbox — added ``section-grid``.
- Implemented responsive breakpoints at 1000px and 700px, plus mobile navigation toggle with ARIA attributes.

- Replaced single hero image with a `picture` element and multiple resolutions (1200/800/400) and `loading="lazy"` to optimise performance.
- Improved accessibility: added `:focus` visible styles to links and buttons, semantic header/footer/ main sections.
- Added `container` class and `--max-width` variable for consistent page widths.
- Included print CSS rules to hide navigation/header for printing.

## Screenshots (required evidence)

### Desktop

\*\* MY WEBSITE IS FUNCTIONAL ON ALL DEVICES. I COULD NOT PROVE IT ON MOBILE AND TABLET AS I DO NOT HAVE ACCESS TO THOSE CURRENTLY. I TRIED WEBSITE TESTING WEBSITES AND COULD NOT BE SUCCESSFUL AS MOST OF THEM REQUIRE PAYMENT AND OTHERS WANT TO CREATE A DOMAIN FOR ME TO HAVE A COMPLIANT URL, WHICH ALSO COMES AT A COST

### References

- MDN Web Docs — Responsive images, CSS Grid, Flexbox.
- W3C — Accessibility guidelines (WCAG quick reference).

### Notes & next steps

- Have the forms filled on the website opposed to making the user download a pdf and send it through email

### End of Part 2
